

The Magic Circle of Water

Did you know that the water you used to wash your face today is the same water that dinosaurs drank millions of years ago? This is because of the **Water Cycle**. Earth recycles its water over and over again through rain, clouds, and oceans. However, even though our planet is called the "Blue Planet," only a tiny part of all that water is fresh and clean enough for us to use.

Being a **Water Scientist** means understanding that water is a finite resource. This means it doesn't just "appear" forever; we must manage it wisely. We can conserve water by turning off the hose while washing the car or collecting rainwater for our plants. By respecting the water cycle, we ensure that the Earth stays healthy for all living things. Remember: every drop saved is a gift to the future!

Reading Comprehension Questions:

- . What is the Water Cycle?
- . Why is it important to save water if the Earth is covered in it?
- . What does "finite resource" mean?.....
